

CAST Publication Impacts Report

WATER AND LAND ISSUES ASSOCIATED WITH ANIMAL AGRICULTURE: A U.S. PERSPECTIVE

CAST Issue Paper 50

Released August 2012

Impact reports compiled September 17, 2012

Chair: Kelly D. Zering, Department of Agricultural and Resource Economics, North Carolina State University, Raleigh

I. ROLLOUT/RELEASE

Agriculture and society have entered a critical phase as global population grows in number and income while availability of land and freshwater for agriculture diminishes. A major challenge identified by the Food and Agriculture Organization of the United Nations (FAO) in 2006 was how to double the global production of livestock products during the next few decades without increasing the environmental damage caused by livestock production and related activities.

The authors of this Issue Paper use a North American (primarily U.S.) perspective to examine the livestock, land, and water issues raised by the FAO in a global setting. The authors draw heavily on published data and literature to look at current status and trends in physical and biological indicators as well as policy and both regulatory and nonregulatory approaches to addressing the issues.
